Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

The present invention relates to low foaming surface active agents. More particularly, the invention aims to provide novel low foaming surface active agents having enhanced biodegradability as well as improved performance as rinse aids in automatic dish washing and hard surface cleaner applications.

Many of the cleaning compositions heretofore recommended for use in connection with the cleaning of tableware have been subject to one or more significant disadvantages. Perhaps the paramount difficulty involved relates to the tendency of such compositions to leave undesirable spots and films on the washed tableware. As will be recognized, aesthetic considerations rather than purely functional criteria are often of overriding importance in regard to the suitability of a given cleaning composition, especially when contemplated for use in connection with the cleaning of tableware.

Further, environmental concerns have placed a premium on developing surfactants having increased biodegradability. Biodegradability is defined as that property possessed by a material enabling it to be decomposed by bacteria or other living organisms.

Ideally, surfactants utilized in the washing of tableware in automatic dishwashers will have a combination of biodegradability characteristics and improved rinsing properties.

The prior art is replete with the disclosure of various surfactant compositions. By way of illustration, U. S. Patent No. 3,956,401 discloses liquid surfactants having the formula:

wherein R is a substantially linear hydrocarbon and more particularly an alkyl group having an average of from about 7 to about 10 carbon atoms; R' is a linear, alkyl hydrocarbon of from about 1 to about 4 carbon atoms; R'' is a linear, alkyl hydrocarbon of from about 1 to about 4 carbon atoms; x is an integer of about 1 to about 6; y is an integer of about 4 to about 15; and z is an integer of about 4 to about 25.

As another illustration, U.S. Patent No. 4,925,587 discloses hydroxyalkyl polyethylene glycol and hydroxyalkyl polypropylene glycol ether surfactants corresponding to the following general formula:

in which

R¹ is a linear C₆-C₁₆ alkyl radical;

R² is a linear or branched, saturated or unsaturated C₁-C₂₂ alkyl radical;

R₃ is hydrogen or a methyl group; and n is a number of from 0 to 30.

As yet another example, U.S. Patent 4,317,940 discloses biodegradable surfactants described as being useful as agricultural emulsifiers and having the following general formula:

wherein R is a linear, alkyl hydrocarbon chain having an average of from about 6 to about 10 carbon atoms; R' is a linear, alkyl hydrocarbon of 1 to about 4 carbon atoms; R'' is a linear, alkyl hydrocarbon of from about 1 to about 4 carbon atoms; x is an integer of from about 8 to about 12; y is an integer from about 19 to about 25; and z is an integer from about 2 to 7.

As still yet another illustration, U. S. Patent No. 4,827,028 discloses the production of anionic surfactants by reacting

an unsaturated dicarboxylic acid such as maleic acid or fumaric acid with at least one epoxy-capped poly(oxyalkylated) alcohol having the formula (A) and (B):

wherein R is a hydrocarbon containing radical having from 1 to about 8 carbon atoms; R₁ is a hydrocarbon containing radical having from about 6 to about 18 carbon atoms; x is an integer having a value from about 6 to about 40 and y is an integer having a value from about 8 to about 50. The ratio of x:y is from about 2:8 to about 8:2; and the mole ratio of dicarboxylic acid to epoxy-capped poly(oxyalkylated) alcohol is from about 1:1 to about 10:1. The above-described surfactants typically have high caustic solubility, which can be an important surfactant characteristic. Unfortunately, an increased emphasis on biodegradability and surfactant cleaning performance in the cleaning of tableware, particularly when utilizing detergent compositions having low phosphate concentrations, has resulted in requirements which are not completely satisfied utilizing the compositions described in the above referenced patents.

It should also be noted that US Patent No. 4,898,621 describes the use of hydroxylalkyl polyethylene glycol ethers corresponding to the following general formula

in which R¹ is hydrogen or a linear C₁-C₁₆ alkyl radical, R² is a linear or branched C₄-C₈ alkyl radical, R³ is hydrogen or a C₁-C₁₆ alkyl radical and n is a number of 7 to 30, with the proviso that the total number of carbon atoms in R¹ and R³ is 6 to 16, and mixtures thereof, in rinse aid compositions for dishwashing machines in addition to other additives typically used in rinse aids.

New nonionic surfactants have been discovered which have surprisingly improved rinsing characteristics, are readily biodegradable, and are low foaming. Their use results in a significant reduction in spotting and filming of tableware, as compared to conventional surfactants, when used in automatic dishwashers.

The invention provides an epoxy-capped poly(oxyalkylated) alcohol characterized by the formula:

wherein R₁ is a linear, aliphatic hydrocarbon radical having from 4 to 18 carbon atoms or a mixture of linear, aliphatic hydrocarbon radicals having an average of from 4 to 18 carbon atoms; and R₂ is a linear, aliphatic hydrocarbon radical having from 2 to 26 carbon atoms or a mixture of linear, aliphatic hydrocarbon radicals having an average of from 2 to 26 carbon atoms; x is an integer having a value from 1 to 3; y is an integer having a value from 5 to 30, the ratio of x:y being between about 1:5 and about 1:30. Preferred surfactant compositions include those in which x is an integer having a value from about 1 to about 2, and more preferably 1. Also preferred are surfactant compositions in which y is an integer having a value from about 10 to about 25, and more preferably from about 10 to about 20.

In another aspect, the present invention provides an automatic dishwasher composition comprising the above-described epoxy-capped poly(oxyalkylated) alcohol and at least one component selected from detergent builder, bleach, anti-wear agent, and mixtures thereof.

In yet another aspect, the present invention provides a cleaning composition for cleaning hard surfaces comprising an aqueous or organic solvent and the above-described epoxy-capped poly(oxyalkylated) alcohol as a surfactant.

These and other aspects will become apparent upon reading the following detailed description of the invention.

The FIGURE is a graph showing the rinse efficacy of the products of the invention, EXAMPLES 1, 2 and 3, and COMPARATIVE EXAMPLES C and D with respect to spotting of washed glassware.

Basically, the surfactants of the present invention consist of four components, namely a linear alcohol, propylene oxide, ethylene oxide, and an epoxy cap. The epoxy cap and the linear alcohol serve as a hydrophobic, oil-soluble portion of the molecule. The ethylene oxide groups form the hydrophilic, water-soluble elements of the molecule.

It has been surprisingly discovered in accordance with the present invention that significant improvements in biodegradability and rinsing characteristics, relative to conventional surfactants, are provided utilizing the compositions of the present invention to clean tableware. Without wishing to be bound by any particular theory, the present inventors believe that this improvement is at least partly attributable to the ordered structure of the compositions in which limited numbers of propylene oxide groups are directly attached to the alcohol followed by addition of the ethylene oxide groups and capping using the 1,2-epoxyalkane. While maintaining this ordered structure, it is desired to also have low ratios of propylene oxide groups to ethylene oxide groups. For example, preferred ratios of propylene oxide groups to ethylene oxide groups are in the range of about 1:5 to about 1:30, and more preferably from about 1:10 to about 1:20.

Generally, these poly(oxyalkylated) alcohols may be made by condensing an aliphatic alcohol, or mixture of alcohols, having an average chain length of from 4 to about 18 carbon atoms, preferably from about 4 to about 12, and more preferably from about 6 to about 10 carbon atoms, initially with propylene oxide followed by capping this condensation product with ethylene oxide. The methods used for condensing and capping may be any of the well-known methods described in the art. Preferably, these reactions occur at elevated temperatures in the range of about 120°C to about 180°C, and more preferably at from about 140°C - 160°C. It is also preferred to carry out such reactions in the presence of an effective amount (e.g. about 0.005% to 1% by weight of the alcohol) of a suitable alkaline catalyst (s) such as hydroxides of alkali metals or alkaline earth metals as well as alkali metal alcoholates and BF₃. The preferred catalyst is KOH.

Epoxy compounds useful for making the epoxy-capped poly(oxyalkylated) alcohols of the present invention include any 1,2-epoxyalkanes, or mixtures thereof, having a hydrocarbon chain containing an average of about 2 to about 26 carbon atoms. Preferably, the 1,2-epoxyalkane has a linear, aliphatic hydrocarbon chain containing an average of from about 8 to about 20 carbon atoms, and more preferably an average of from about 10 to about 16 carbon atoms. Generally, 2 to 4 carbons is preferred if a high cloud point composition is desired, 6 to 10 carbons is preferred to optimize defoaming efficacy, and 12 to 22 carbons is desired to optimize rinsing efficacy. Various 1,2-epoxyalkane compounds are commercially available from Atochem North America Inc., Philadelphia, PA under the product names VIKALOX 11-14, VIKALOX 12, VIKALOX 16 and others.

The novel surfactant compositions of the present invention provide improved surface treatment of the tableware by the rinse water and subsequently reduces spotting and filming. These epoxy-capped poly(oxyalkylated) alcohols can be formulated in powder and liquid detergent products for automatic dishwashers or in hard surface cleaning products, such as bathroom tile cleaners using methods commercially practised in the detergent industry. These formulations can include, for example, detergent builders, chelating agents, bleaches, anti-wear agents, and combinations thereof, among others.

Suitable detergent builders include inorganic builders such as sodium tripolyphosphate (STPP), sodium carbonate, zeolites and mixtures thereof. Where STPP is the detergent builder, the STPP may be employed in the compositions in a range of about 8 to 35 wt. %, preferably about 20 to 30 wt %, and should preferably be free of heavy metal which tends to decompose or inactivate the preferred sodium hypochlorite and other chlorine bleach compounds. The STPP may be anhydrous or hydrated, including the stable hexahydrate with a degree of hydration of 6 corresponding to about 18% by weight of water or more.

Organic builders can also be used including nitrilotriacetic acid and alkali metal salts of tartaric or citric acid.

Where used, a chelating agent can be any one of a wide range of organic or inorganic sequestering agents, examples including phosphoric acid, amino polycarboxylic acids such as EDTA, NTA and DETPA, and polycarboxylic acids such as lactic acid, citric acid, tartaric acid, gluconic acid, glucoheptonic acid, mucic acid, galactonic acid, saccharic acid, fumaric acid, succinic acid, glutaric acid, adipic acid and their alkali metal or ammonium salts. Citric or tartaric acid are preferred chelating acids. The chelating agent if included is present in an amount of up to about 30% and normally lies in the range from about 5% to about 20% by weight. Highly preferred compositions use from about 5% to about 10% by weight of chelating agent in order to minimize any attack by the chelating agent on the glass.

When a bleach is a component in the formulation, the bleach may be an organic chlorine containing bleach, for example, trichloroisocyanuric acid, dichloroisocyanuric acid or a salt of dichloroisocyanuric acid. Preferably a sodium or potassium salt such as trichloroisocyanuric acid is employed in an amount of, for example, 1 to 5% and more preferably 2 to 3% by weight in the cleaning composition. Inorganic bleaching compounds such as chlorinated trisodium polyphosphate (TSPP) or lithium hypochlorite may also be used.

The dishwasher formulations may also include anti-wear or anti-corrosion agents such as an alkali metal silicate, preferably sodium silicate, and may be present in a ratio of 0.1 to 3 and preferably 0.2 to 1 mole per mole of alkali in the cleaning composition.

Alkalinity may be provided by an alkali metal compound, for example, sodium or potassium hydroxide and/or carbonate.

Further suitable conventional ingredients for inclusion in the compositions are hydrotropic agents such as xylene sulfonates, alcohols, perfumes and coloring agents.

5 While the invention has been described above with reference to specific embodiments thereof, it is apparent that many changes, modifications and variations can be made without departing from the inventive concept disclosed herein.

The following examples are provided to further illustrate the invention. All parts and percentages are by weight unless otherwise specified.

10 EXAMPLE 1

To a 1000 ml round bottom 3-necked flask fitted with a thermometer, on which is placed a thermowatch sensor, a magnetic stirring bar, an equilibrated dropping funnel fitted with a nitrogen inlet, a dry-ice/acetone condenser, and a nitrogen outlet, was added 100 grams (0.6827 moles) of Alfol-610 (Vista Chemical) and 0.4 grams (0.007 moles) of KOH. The alcohol is stirred and heated to 140°C for 1.5 hours. At the end of this time 39.60 grams (0.6827 moles) of propylene oxide was added dropwise over one hour. The reaction was complete when refluxing ceased in the dry-ice/acetone condenser. The mixture was post reacted for 1.5 hours at 140°C. Ethylene oxide, 450.58 grams (10.24 moles) was then added slowly over 6-8 hours under slow reflux. The reaction mixture was then post-reacted for 1.5 hours at 140°C. At the end of this time 151.1 grams (0.629 moles) of 1,2-epoxyhexadecane (Atochem) was added through the dropping funnel. The addition took place over a period of less than 10 minutes. The reaction mixture was post-reacted at 160 ± 3°C for 4.5 hours. At the end of this time the solid product was cooled and removed from the flask. The cloud point of a one percent solution of the product in water was <1°C. The hydroxyl number was 56.2 and the primary hydroxyl content was 18.3%.

25 EXAMPLE 2

To the identical apparatus used in Example 1 was added 100 grams (0.6827 moles) of Alfol-610 (Vista Chemical) and 0.4 grams (0.007 moles) of KOH. The alcohol was stirred and heated to 140°C for 1.5 hours. At the end of this time 39.60 grams (0.6827 moles) of propylene oxide was added dropwise over one hour. When refluxing ceased in the dry-ice/acetone condenser the reaction was complete. The mixture was post reacted for 1.5 hours at 140°C. Ethylene oxide, 600.78 grams (13.654 moles) was then added slowly over 6-8 hours under slow reflux. The reaction mixture was then post-reacted for 1.5 hours at 140°C. To the reaction mixture 116.2 grams (0.480 moles) of 1,2-epoxyhexadecane (Atochem) was added through the dropping funnel in less than 10 minutes. The reaction mixture was post-reacted at 160 ± 3°C for 4.5 hours. At the end of this time the solid product was cooled and removed from the flask. The cloud point of a one percent solution of the product in water was 8°C. The hydroxyl number was 48.7 and the % primary hydroxyl was 19.7.

40 EXAMPLE 3

Using the identical apparatus of Examples 1 and 2, 100 grams (0.6827 moles) of Alfol-610 (Vista Chemical) and 0.4 grams (0.007 moles) of KOH were added to the flask. The alcohol was stirred and heated to 140°C for 1.5 hours. At the end of this time 39.60 grams (0.6827 moles) of propylene oxide was added dropwise over one hour. The reaction was completed when refluxing ceased in the dry-ice/acetone condenser. The mixture was post reacted for 1.5 hours at 140°C. Ethylene oxide, 600.78 grams (13.654 moles) was then added slowly over 6-8 hours under slow reflux. The reaction mixture was then post-reacted for 1.5 hours at 140°C. Next 74.88 grams (0.480 moles) of 1,2-epoxydecane (Atochem) was added through the dropping funnel in a period of less than 10 minutes. The reaction mixture was post-reacted at 160 ± 3°C for 4.5 hours. At the end of this time the solid product was cooled and removed from the flask. The cloud point of a one percent solution of the product in water was 14°C. The hydroxyl number was 53.0 and the primary hydroxyl content was 25.6%.

EXAMPLES 4-6 AND COMPARATIVE EXAMPLES A, B and C

55 Loads of tableware including ten 9 inch dinner plates, 10 soda glasses, and assorted tableware were subjected to 5 washing cycles in a Hobart Superba model dishwasher. The washing cycles comprised one wash cycle and two rinses. The maximum temperature during the wash cycle is approximately 137°F (58.3°C) and the tableware washing is completed in 70 minutes.

The tableware were washed with each of the products of Examples 1, 2 and 3. In addition, the tableware was

washed under identical conditions with a commercial surfactant, Cascade (Procter & Gamble Co.). As additional comparisons, the formulation of Comparison B was tested under identical conditions utilizing the surfactant of Example 8 of U.S. Patent 3,956,401, and Comparison C utilized the surfactant of Example 7b of U.S. Patent 4,925,587. For each washing cycle 20 grams of detergent, including 0.6 grams of surfactant, were used. After each washing, the glassware was evaluated for spotting, streaking and filming using a scale of 1 to 5 in which 1 shows no spots, streaks or film, and 5 indicates the glasses were completely covered with spots, streaks and film. This testing procedure closely follows the Chemical Specialties Manufacturing Association (CSMA) Test procedure DCC 05A. The results are given in Table I below.

TABLE I

Glassware Rinsing In Automatic Dishwasher			
Example No.	Spotting	Streaking	Filming
4. Product of Example 1	2.5	1.0	1.7
5. Product of Example 2	2.1	1.0	2.1
6. Product of Example 3	1.4	1.0	3.1
Comp. A, Cascade	3.5	1.0	3.3
Comp. B, Example 8 of U.S. Patent 3,956,401	3.5	1.0	3.4
Comp. C, Example 7b of U.S. Patent 4,925,587	4.7	1.0	3.9

Glassware cleaned using the products of the invention clearly show a significant improvement in spotting and filming over the commercial detergents. The spotting data is shown graphically in Figure 1.

EXAMPLE 7 AND COMPARATIVE EXAMPLES D AND E

An Automatic Dishwashing Foam Test (CSMA DCC-01) was used to evaluate products of this invention. Also tested were a commercial product, "Cascade" (a trademarked commercial product of Procter & Gamble) and the product of Example 7b of U.S. Patent No. 4,925,587. Milk and egg soils were employed in these tests. Measurements were made of the ratio of the revolutions of the dishwasher rotor with detergent and soil as a percentage of the revolutions with water alone. The higher the ratio, the more efficient is the detergent. From the results provided in Table 2 hereinbelow, it is readily apparent that the product of this invention compares very favorably with the comparative example products. Results are shown in Table 2.

Claims

1. An epoxy-capped poly(oxyalkylated) alcohol characterized by the formula:

wherein R_1 is a linear, aliphatic hydrocarbon radical having from 4 to 18 carbon atoms or a mixture of linear, aliphatic hydrocarbon radicals having an average of from 4 to 18 carbon atoms; R_2 is a linear, aliphatic hydrocarbon radical having from 2 to 26 carbon atoms or a mixture of linear, aliphatic hydrocarbon radicals having an average of from 2 to 26 carbon atoms; x is an integer having a value from 1 to 3; and y is an integer having a value from 5 to 30, the ratio of $x:y$ being between about 1:5 and about 1:30.

2. The epoxy-capped poly(oxyalkylated) alcohol of claim 1 wherein the R_2 carbon atom range is from 2 to 14 carbon atoms.
3. The epoxy-capped poly(oxyalkylated) alcohol of claim 1 or 2 wherein x is from 1 to about 2.
4. The epoxy-capped poly(oxyalkylated) alcohol of claim 1, 2 or 3 wherein y is from about 10 to about 25.
5. The epoxy-capped poly(oxyalkylated) alcohol of claim 1, 2, 3 or 4 wherein the R_1 carbon atom range is from 4 to 12 carbon atoms.
6. The epoxy-capped poly(oxyalkylated) alcohol of claim 4 wherein x is 1.
7. An automatic dishwasher composition comprising an epoxy-capped poly(oxyalkylated) alcohol of any preceding claim and at least one component selected from detergent builder, bleach, anti-wear agent, and combinations thereof.
8. A cleaning composition for cleaning hard surfaces comprising an aqueous or organic solvent and an epoxy-capped poly(oxyalkylated) alcohol surfactant of any one of claims 1-6.
9. A method for cleaning soiled tableware which comprises contacting the soiled tableware in a dishwashing machine in an aqueous wash bath characterized by having dispersed therein an effective amount of the composition of claim 7 to obtain clean tableware having substantially reduced films and spots.
10. A method for cleaning hard surfaces which is characterized by contacting the hard surfaces with an effective amount of the composition of claim 8 to obtain said cleaning of said hard surfaces.

Patentansprüche

1. Polyoxyalkylierter Alkohol mit Epoxidkappe gekennzeichnet durch die Formel:

in der R_1 ein lineares, aliphatisches Kohlenwasserstoffradikal mit 4 bis 18 Kohlenstoffatomen oder ein Gemisch aus linearen, aliphatischen Kohlenwasserstoffradikalen mit durchschnittlich 4 bis 18 Kohlenstoffatomen ist, R_2 ein lineares, aliphatisches Kohlenwasserstoffradikal mit 2 bis 26 Kohlenstoffatomen oder ein Gemisch aus linearen, aliphatischen Kohlenwasserstoffradikalen mit durchschnittlich 2 bis 26 Kohlenstoffatomen ist, x eine ganze Zahl mit einem Wert von 1 bis 3 ist und y eine ganze Zahl mit einem Wert von 5 bis 30 ist, wobei das Verhältnis von x: y zwischen etwa 1:5 und etwa 1:30 liegt.

2. Polyoxyalkylierter Alkohol mit Epoxidkappe nach Anspruch 1, bei dem der Bereich der Kohlenstoffatome von R_2 2 bis 14 Kohlenstoffatome beträgt.
3. Polyoxyalkylierter Alkohol mit Epoxidkappe nach Anspruch 1 oder 2, bei dem x 1 bis etwa 2 beträgt.
4. Polyoxyalkylierter Alkohol mit Epoxidkappe nach Anspruch 1, 2 oder 3, bei dem y etwa 10 bis etwa 25 beträgt.
5. Polyoxyalkylierter Alkohol mit Epoxidkappe nach Anspruch 1, 2, 3 oder 4, bei dem der Bereich der Kohlenstoffatome von R_1 4 bis 12 Kohlenstoffatome beträgt.
6. Polyoxyalkylierter Alkohol mit Epoxidkappe nach Anspruch 4, bei dem x 1 ist.
7. Zusammensetzung für einen automatischen Geschirrspüler, aufweisend einen polyoxyalkylierten Alkohol mit Epoxidkappe gemäß irgendeinem vorangehenden Anspruch und mindestens einen Bestandteil, der ausgewählt ist aus Reinigungsmittel-Buildern, Bleichmitteln, Verschleißschutzmitteln und Kombinationen davon.
8. Reinigungszusammensetzung zum Reinigen harter Oberflächen, aufweisend ein wäßriges oder organisches Lö-

sungsmittel und ein oberflächenaktives Mittel in Form eines polyoxyalkylierten Alkohols mit Epoxidkappe gemäß irgendeinem der Ansprüche 1 bis 6.

- 5 9. Verfahren zum Reinigen verunreinigter Tischware, welches ein in Berührung Bringen der verunreinigten Tischware mit einem wäßrigen Reinigungsbad in einer Geschirrspülmaschine aufweist, dadurch gekennzeichnet, daß in dem Reinigungsbad eine wirksame Menge der Zusammensetzung gemäß Anspruch 7 verteilt ist, um saubere Tischware mit wesentlich verringerten Belägen und Flecken zu erhalten.
- 10 10. Verfahren zum Reinigen harter Oberflächen, welches gekennzeichnet ist durch ein in Berührung Bringen der harten Oberflächen mit einer wirksamen Menge der Zusammensetzung gemäß Anspruch 8, um die Reinigung der harten Oberflächen zu erzielen.

Revendications

- 15 1. Alcool poly(oxyalkylé) coiffé par un époxy caractérisé par la formule :

20 dans laquelle R_1 est un radical hydrocarboné aliphatique, linéaire ayant de 4 à 18 atomes de carbone ou un mélange de radicaux hydrocarbonés aliphatiques, linéaires ayant une moyenne de 4 à 18 atomes de carbone ; R_2 est un radical hydrocarboné aliphatique, linéaire ayant de 2 à 26 atomes de carbone ou un mélange de radicaux hydrocarbonés aliphatiques, linéaires ayant une moyenne de 2 à 26 atomes de carbone ; x est un entier ayant une valeur de 1 à 3 ; et y est un entier ayant une valeur de 5 à 30, le rapport x : y étant entre environ 1 : 5 et environ 1 : 30.

- 25 2. Alcool poly(oxyalkylé) coiffé par un époxy selon la revendication 1, caractérisé en ce que l'intervalle d'atomes de carbone de R_2 est de 2 à 4 atomes de carbone.
- 30 3. Alcool poly(oxyalkylé) coiffé par un époxy selon la revendication 1 ou 2, caractérisé en ce que x est de 1 à environ 2.
- 35 4. Alcool poly(oxyalkylé) coiffé par un époxy selon la revendication 1, 2 ou 3, caractérisé en ce que y est d'environ 10 à environ 25.
- 40 5. Alcool poly(oxyalkylé) coiffé par un époxy selon la revendication 1, 2, 3 ou 4, caractérisé en ce que l'intervalle d'atomes de carbone de R_1 est de 4 à 12 atomes de carbone.
- 45 6. Alcool poly(oxyalkylé) coiffé par un époxy selon la revendication 4, caractérisé en ce que x est égal à 1.
- 50 7. Composition de lavage de vaisselle automatique comprenant un alcool poly(oxyalkylé) coiffé par un époxy selon l'une quelconque des revendications précédentes et au moins un constituant choisi parmi un additif de détergence, un agent de blanchiment, un agent anti-usure et leurs combinaisons.
- 55 8. Composition de nettoyage pour le nettoyage de surfaces dures, comprenant un solvant aqueux ou organique et un alcool poly(oxyalkylé) coiffé par un époxy selon l'une quelconque des revendications 1 à 6.
9. Procédé de nettoyage de vaisselle souillée comprenant la mise en contact de la vaisselle souillée dans une machine à laver la vaisselle dans un bain de lavage aqueux, caractérisé en ce qu'on a dispersé dans celui-ci une quantité efficace de la composition selon la revendication 7 pour obtenir une vaisselle nettoyée ayant des films et des points sensiblement réduits.
10. Procédé de nettoyage de surface dure, caractérisé en ce que l'on met en contact les surfaces dures avec une quantité efficace de la composition selon la revendication 8 pour obtenir ledit nettoyage desdites surfaces dures.
